國立臺灣科技大學
九十一學年度碩士班招生考試試題

系所組別： 機械工程系丙組
科　目： 熱力學

每題二十分,總分一百分.

1. A 50 *kg* copper block initially at 100 ℃ (Cp=0.39 *kJ/kg k*) is dropped into an insulated tank which contains 120 *kg* of water (Cp=4.184 *kJ/kg k*) at 25 ℃. Determine the final equilibrium temperature and the total entropy change for this process.
2. An insulated rigid tank is divided into two equal parts by a partition. Initially, one part contains 5 *kg* of nitrogen at 200 *kPa* and 60 ℃, and the other part is evacuated, The partition is now removed. and the gas expands into the entire tank. Determine the final pressure and temperature in the tank.
3. A closed system initially contains steam at 300 *kPa* and 150 ℃(state 1) with a volume of 1.2 m^3, compressed by a process $pv^{1.3} = constant$ to 1.6 MPa (state 2), then cooled under constant volume to state 3, and then returns to state 1 by an isothermal process. Draw this cycle on a *p-v* diagram, and determine (a) the temperature of state 2, and (b) the mass and volume of liquid water at state 3.
4. A refrigerator uses R134A as the working fluid and operates on an ideal vapor-compression refrigeration cycle between 0.14 and 0.7 *MPa*. If the mass flow rate of the refrigerant is 0.042 *kg/s*, determine (a) the rate of heat removal from the refrigerated space and the power input to the compressor, (b) the rate of heat rejection to the environment, and (c) the COP of the refrigerator.
5. A silicon chip is encapsulated such that, under steady-state conditions, all of the power it is transferred by convection to a fluid stream for which h = 800 W/m^2-K and T_∞ = 35℃. The chip is separated from the fluid by a 2-*mm*-thick aluminum cover plate, and the contact resistance of the chip/aluminum interface is 0.5×10^{-4} m^2-K/W. If the chip surface is 100 mm^2 and its maximum allowable temperature is 85 ℃, what is the maximum allowable power dissipation in the chip?

Assume K= 238 W/mK, For Aluminum
