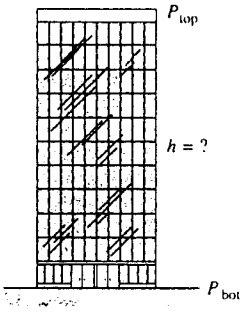
國立臺灣科技大學
九十二學年度碩士班招生考試試題
系所組別：機械工程系碩士班丙組
科　目：熱力學

（總分：100 分，每大題 20 分，每大題之每小題 10 分）

1. If the barometric readings at the top and at the bottom of a building are 730 and 750 mmHg, respectively, determine the height of the building. Assume the average air density is approximately equal to that at the standard reference state (P = 1*atm*, T = 25°*C*). The molar mass of air is 28.97 *kg/kmol*.



2. Consider ideal two-stage polytropic compression with intercooling. Show that to minimize compression work during two-stage compression, the pressure ratio across each stage of the compressor must be the same.

3. A piston-cylinder device contains 30*g* of saturated water vapor that is maintained at a constant pressure of 200 *kPa*. A resistance heater within the cylinder is turned on and passes a current of 0.2 *A* for 5 min from a 110-*V* source. At the same time a heat loss of 3.5 *kJ* occurs. (a) Show that for a closed system the boundary work W_b and the change in internal energy ΔU in the energy conservation relation can be combined into one form, ΔH, for a constant pressure process. (b) Determine the final temperature of the steam.

4. A rigid tank with volume 1 m^3 is filled with air at a gage pressure of 7 *bars* and a temperature of 300°*C*. Determine (a) the final temperature, and (b) the quantity of mass that left in the tank if the air is permitted to leave the tank under reversible adiabatic conditions until the gage pressure drops to 1 *bar*.
Note: For air, the specific heat ratio is approximately equal to 1.4.

5. The temperature distribution across a wall 50 *cm* thick at a certain instant of time is given as

$$T(x) = a + bx + cx^2,$$

where T is in $^\circ C$ and x is in meters, while $a = 1000^\circ C$, $b = -400\ ^\circ C/m$, and $c = -50^\circ C/m^2$. A uniform heat generation, $q''' = 900 W/m^3$, is present in the wall of area $12\,m^2$ having the properties k (thermal conductivity) = $40 W/m \cdot K$, and α (thermal diffusivity) = $6.25 \times 10^{-6} m^2/s$.

(a) Determine the rate of change of energy storage in the wall.

(b) Determine the time rate of temperature change at $x = 0$, 0.25, and 0.5 *m*.
