

國立台灣科技大學九十八學年度碩士班招生試題

系所組別：工業管理系碩士班甲組、乙組、丙組
 科目：統計學

(總分為 100 分)

(Total 100 Points.) There are 7 Problems in this exam. Show intermediate steps and formulas for partial credit. You must explain how you compute your results or answers for full credit.

- (10 points) Let $P(X) > 0$, $P(Y_i) = 1$ for all $i = 1, 2$. Prove or disprove: $P(X \cap Y_1 \cup \bar{Y}_2) = P(X)$.
- (10 points) A random variable X has the Poisson distribution.
 - Find $M_X(t)$, the moment-generating function of X .
 - Using $M_X(t)$, find the mean and variance of the Poisson distribution.
- (10 points) A soft drink vending machine has a random amount X gallons in supply at the beginning of a given day. It dispenses an amount Y gallons during the day. Assuming that the machine is not resupplied during the day and X, Y have joint density function

$$f(x, y) = \begin{cases} \frac{1}{x^2 y^2}, & 1 \leq y, 1 \leq x, \\ 0, & \text{otherwise.} \end{cases}$$

- Find the marginal distribution of X and Y .
 - Let $U = XY$, find the probability density function of U .
- (10 points) If a set of observations is normally distributed, what percent of these differ from the means by
 - more than 1.5σ ?
 - less than 0.68σ ?
 - (10 points)

The systolic blood pressures of 15 people before and after a 5-kilometer run are as follows:

Weight	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Before	150	164	160	155	159	138	163	159	149	158	161	132	155	146	145
After	156	172	163	161	170	147	167	169	158	164	164	133	160	154	147

Use the sign test at the 0.05 level of significant to test the null hypothesis that running 5 kilometers increases the median systolic blood pressures by 8 points against the alternative hypothesis that the median is less than 8 points.

- (30 points: each sub-problem with 10 points)

A random sample of $n=15$ parts is tested for strength and sample mean=2.68 with known variation 0.81. Also, the strength of all parts is normally distributed.

- Test $H_0: \mu = 3$ versus $H_1: \mu \neq 3$ using $\alpha = 0.05$.
- What is the power of this test if $\mu = 3.25$?
- What sample size would be required to detect a true mean of 3.75 if we wanted the power to be at least 0.9?

國立台灣科技大學九十八學年度碩士班招生試題

系所組別：工業管理系碩士班甲組、乙組、丙組

科目：統計學

(總分為 100 分)

7. (20 points: each sub-problem with 10 points)

Consider the simple linear regression model $y = X\beta + \varepsilon = [1 \quad x] \begin{bmatrix} \beta_0 \\ \beta_1 \end{bmatrix} + \varepsilon$ and assume that

$E(\varepsilon) = 0$, $V(\varepsilon) = \sigma^2$ and the errors ε uncorrelated. Note: $SST = SSR + SSE$.

a) Show that $E(\hat{\sigma}^2) = E(MSE) = \sigma^2$.

b) Show that $E(MSR) = \sigma^2 + \beta_1^2 S_{XX}$.
